

- Drag the original workbook epub file into the “epubs” folder

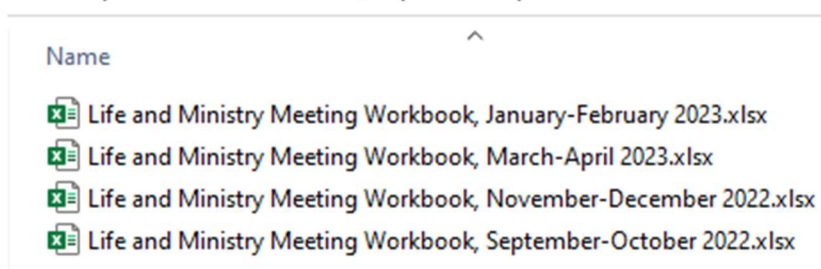

- Make sure there is only **one** epub file in the epub's folder (The program will not run otherwise)
- Double click on the “schedule\_helper.py” file

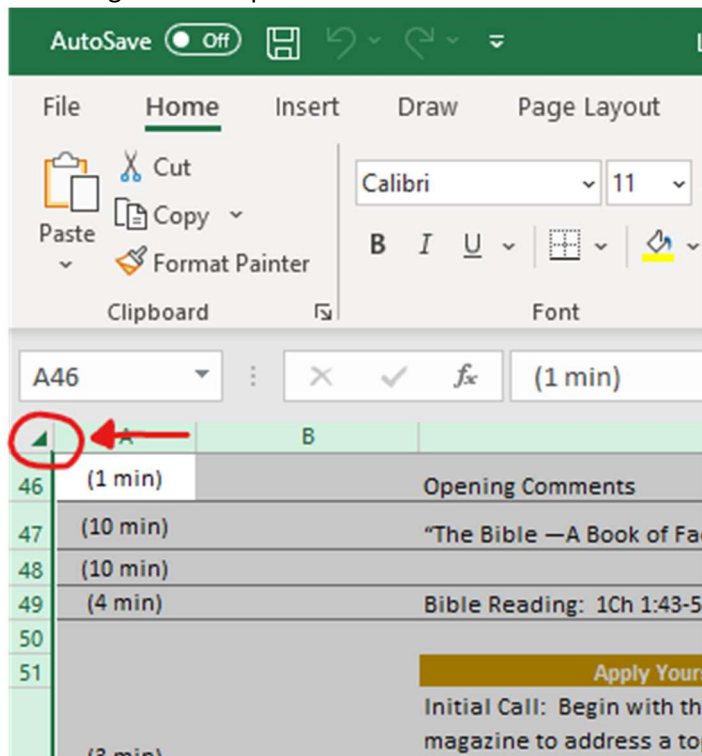

- The generated spreadsheets will be stored in the “output” folder, given names according to the workbooks that were used to create them

Desktop > Code > schedule\_helper > output

- All that needs to be done to the generated spreadsheets is to alter the row height. Click on the triangle in the top corner shown here to select all cells

- With all cells still selected, click the down arrow under the format menu and select “AutoFit Row Height”
